Maximum Marks	4 Marks

Empathy Map

Create an empathy map to understand your customer/user from four perspectives - what they Say, Think, Do, and Feel - in relation to the problem your project addresses. This helps the team build a customer-centric solution.

SAYS • Reviewing combined demographic sheets and month-by-month repayment profiles line by line takes too much time. • The volume of applications spikes every month, creating a massive processing backlog. • We need an objective, data-driven framework that can instantly screen out obviously unsafe profiles before they reach my desk.	THINKS • I think human bias or fatigue might be causing us to accidentally reject safe applications or accept high-risk ones. • Legacy linear scoring models are too rigid; they don't capture complex income structures or non-linear patterns. • Will an automated system completely replace my job, or will it act as a smart tool to accelerate my daily output?
	PERSONA NAME <i>Bank Credit Risk Officer / Reviewer</i>

DOES

- Manually opens separate databases (application_record and credit_record) to cross-reference customer profiles.
- Uses spreadsheets to calculate simple credit balances and flags serious past-due markers manually.
- Signs off on approval documents or writes down detailed justification notes for account rejections.

FEELS

- **Pains (Frustrations):** Stressed by the endless backlog of applications, anxious about manual calculation mistakes, and frustrated by slow, legacy banking tools.
- **Gains (Aspirations):** Desires a fast, streamlined local dashboard interface where a customer's details can be inputted to receive an instantaneous, balanced classification verdict. Wants to feel confident, efficient, and technologically empowered in their day-to-day work.
